

UI Development with SAP Fiori

Launchpad, Design & Flexibility

Final Session — Full Course Review Before the Exam

SESSION 6 • UX410 • 2 HOURS

C_FIORD: Fiori Overview & Launchpad — 11–20% | Plus: Full-Course Review

UX410: UI Development with SAP Fiori (5 units, 1h 50min, Advanced)

learning.sap.com/courses/ui-development-with-sap-fiori

Why This Is Your Final Review Session

UX410 covers Fiori Overview & Launchpad directly — and this session reviews every other topic below before you sit the exam

Topic	Weight	Course	Session
SAP Fiori Elements & FPM	21–30%	UX405, UX406	Sessions 4–5
Fiori Elements Annotations	11–20%	UX405, UX406	Sessions 4–5
OData and SAP BTP	11–20%	UX405, UX406	Sessions 4–5

← UX410 is your last new-content topic — Fiori Overview & Launchpad. Everything else above gets a full review today too.

Complete Unit Coverage — Today's Roadmap

All 5 units of UX410

U1

Golden Rules of SAPUI5 Development

Consistent, Simple, Adaptive, Delightful

10min

U2

SAP Fiori Launchpad

Tiles, Spaces/Pages vs Catalogs/Groups

20min

U3

SAP Fiori Launchpad Configuration

Target mappings, catalogs, semantic objects

40min

U4

Applying SAP Fiori Design Guidelines

Content density, accessibility, floorplan choice

20min

U5

Utilizing SAPUI5 Flexibility

Key user adaptation — not the same as FPM

20min

UX410

Golden Rules + SAP Fiori Launchpad

Units 1–2 • Design principles and the Launchpad home page

U1: Golden Rules + U2: SAP Fiori Launchpad

Design principles first, then the home page every Fiori app launches from

Golden Rules of SAPUI5 Development (U1)

Consistent	Same interaction patterns and terminology across every Fiori app
Simple	Show only what's needed for the task — progressive disclosure
Adaptive	Same app works on desktop, tablet, and phone — no separate build
Delightful	Fast and helpful — performance is a design requirement, not polish
Guidelines Site	fioridesignguidelines.com — the canonical, living reference

SAP Fiori Launchpad (U2)

Role-Based Home Page	Users see only tiles relevant to their assigned roles
Tile	The clickable entry point — dynamic (live data) or static
Modern Model	Space → Page → Section → Tile
Classic Model	Catalog → Group → Tile
Coexistence	Both models can run on the same system during a transition

Exam Trap ★

Spaces/Pages and Catalogs/Groups are two different Launchpad content models, not two names for the same thing. Spaces/Pages is the newer, role-based model; Catalogs/Groups is the classic one many landscapes still run. The exam can describe either — the giveaway is the vocabulary used.

UX410

SAP Fiori Launchpad Configuration

Unit 3 • Where your intent-based navigation annotations finally resolve

U3: SAP Fiori Launchpad Configuration

Where your Session 4/5 intent-based navigation annotations actually resolve

Core Configuration Objects (U3)

- Semantic Object: a business entity name shared across apps, e.g. 'Flight'
- Action: what to do with it, e.g. 'displayFactSheet'
- Target Mapping: resolves the intent — opens a specific app
- Catalog: collection of tiles + mappings, assigned via PFCG role
- Group: personalizable, user-facing collection of tiles
- Business Catalog: SAP-delivered, pre-built for a business role

The Full-Circle Moment

- Sessions 4–5 built `@UI.DataFieldWithIntentBasedNavigation`
- That annotation only ever specified WHERE to send an intent
- SemanticObject + Action together ARE the intent it fired
- This unit's Target Mapping is what actually catches it
- No matching Target Mapping = the button click goes nowhere
- Exactly what you saw when testing it earlier in the course

Target Mapping — What It Actually Configures

```
Semantic Object:  Flight
Action:           displayFactSheet
App Type:         SAPUI5 Fiori App
Title:            Flight Details
URL:              /sap/bc/ui5_ui5/sap/zflights4_op
Navigation Mode:  Explace / Inplace
```

UX410

Design Guidelines + SAPUI5 Flexibility

Units 4–5 • Content density, accessibility, and key user adaptation

U4: Design Guidelines + U5: SAPUI5 Flexibility

Content density, accessibility • key user adaptation vs FPM

U4: Applying SAP Fiori Design Guidelines

- Content density: Cozy (touch-friendly) vs Compact (denser)
- Users can often switch density at runtime, no redeployment
- Floorplan selection is itself a guideline decision, not just technical
- List Report for browse-then-drill; OVP for KPI dashboards
- Accessibility: keyboard nav, screen-reader labels, colour contrast
- Fiori Elements floorplans meet these by default — SAP tested them
- Freestyle SAPUI5 apps must apply every guideline manually

U5: Utilizing SAPUI5 Flexibility

- Key User Adaptation (RTA): a key user adapts a running app, no code
- Rename labels, hide fields, rearrange columns — in the browser
- Changes are stored as flexibility layers on top of the app
- Variant Management: save and share filter/layout combinations
- Works on Fiori Elements and freestyle SAPUI5 — a UI5 capability
- Runtime, no-code, business key user — categorically different from FPM
- FPM = build-time, developer-authored custom code — not the same thing

Exam Trap ★

SAPUI5 Flexibility and FPM both involve ‘extending’ an app, but they are not the same mechanism. Flexibility = runtime, no-code, business key user. FPM = build-time, custom XML/JS, developer. ‘Key user’ or ‘adapt UI’ → Flexibility. ‘Custom sections’ or ‘Building Blocks’ → FPM.

UX410

Full Course Review + Exam Day Prep

Everything from Sessions 2–5, consolidated — plus what to expect on exam day

Course Progression + Deployment Wrap-Up

Everything covered so far, and the one topic outside UX410's syllabus worth one last look

Course Progression (Sessions 2–6)

Session 2 · UX100

Fiori overview, Launchpad basics, floorplan introduction

Session 3 · UX400/402

SAPUI5 foundations — views, controllers, models, routing

Session 4 · UX405/406 (RAP)

Fiori Elements on ABAP RAP — annotations, FPM, live build

Session 5 · UX405/406 (CAP)

Same concepts on CAP — same annotations, different syntax

Session 6 · UX410

Launchpad configuration, Design Guidelines, SAPUI5 Flexibility

Deployment Wrap-Up — RAP vs CAP

Package / Compile

RAP: activate CDS in ADT | CAP: cds build --production

Descriptor

RAP: transport request | CAP: cds add mta → mta.yaml

Publish

RAP: MAINT_SERVICE/V4_ADMIN | CAP: mbt build + cf deploy

Destination

RAP: ABAP system, on-prem/BTP | CAP: Cloud Foundry or Kyma

Recognition Rule

Transport / MAINT_SERVICE → RAP. mta.yaml / cf deploy → CAP.

Exam Trap ★

Deployment mechanics genuinely differ between RAP and CAP — not just syntax, unlike most of this course. RAP promotes through transport requests inside the ABAP system; CAP packages and deploys as a Multi-Target Application to Cloud Foundry or Kyma on SAP BTP.

Exam Day Prep + Open Q&A

What to expect, and questions worth asking yourself before you sit down

What to Expect

- C_FIORD is scenario-based — most questions describe a situation
- Recognition beats memorisation — RAP vs CAP, bound vs unbound
- Flexibility vs FPM is fresh from today — expect at least one question
- Time pressure is real — flag ambiguous questions and move on
- High-weight topics deserve the most review time: FE & FPM, Annotations
- Low-weight topics (ALP/HANA, deployment) are safe to deprioritise
- One clean pass beats three anxious re-reads — trust your prep

Good Questions to Ask Yourself

- Can you write @UI.LineItem and @UI.Facets from memory, both syntaxes?
- Given a scenario, can you say in one sentence: RAP or CAP, and why?
- Do you know Spaces/Pages vs Catalogs/Groups cold?
- Can you explain why Flexibility and FPM aren't the same thing?
- Which exam traps from Sessions 4–6 do you still hesitate on?
- Could you rebuild the Flight scenario from memory, either backend?
- Do you know your exam logistics — time, location, ID requirements?

Exam Trap ★

The most common last-minute mistake: over-studying edge cases (ALP/HANA specifics) while under-reviewing the highest-weight topic (Fiori Elements & FPM annotations). Spend your final review hours where the points actually are.

Final Checklist Before the Exam

This is the last content session — from here, review is self-directed

No Session 7 — next stop is the C_FIORD certification exam itself

1

Re-read every ‘Know These Cold’ page

Sessions 2 through 6, in one sitting, without notes

2

Rebuild the Flight scenario from memory

Both RAP and CAP — the ultimate readiness check

3

Drill the full exam trap list

RAP vs CAP, bound vs unbound, Flexibility vs FPM, Spaces/Pages vs Catalogs/Groups

4

Confirm your exam logistics

Time, location or proctoring requirements, ID — at least a day ahead

5

Trust the work you’ve put in

You’ve built this app twice, on two backends, and debugged it live on a real system
